LANBAO

Optical fiber sensor   FD3 series

Operation manual

Precautions

- Please make sure that the power supply voltage is within the rated value before powering on

- The sensor can be detected normally until 100ms after the power is turned on

- When using different power sources for the sensor and load, be sure to turn on the power of the sensor first

- When the sensor is not used, it is recommended to cut off the power of the load first and then turn off the power of the sensor

- Do not subject the sensor to severe external forces (such as hammer hits, etc.) during installation, so as not to damage the sensor performance

- Avoid using thinner, alcohol or other organic solvents when cleaning

Safety Warning

- Do not use in an environment with flammable, explosive or corrosive gases
- Do not use in oil or chemical environments
- Do not use in a high humidity environment
- Do not use in direct sunlight
- Do not use in other environmental conditions that exceed the rated value
- Do not disassemble, repair or modify this product without authorization

Scrap Treatment

- When the product is scrapped, please dispose of it as industrial waste

промышленные датчики

■ Technical specifications

Model	NPN	FD3-NB11R
	PNP	FD3-PB11R
Light source		Red LED
Response time		50μs(HIGH SPEED)/ 250μs(FINE) / 1ms(SUPER) / 16ms(MEGA)
Output state		NO/NC optional
Delay function		Off-delay timer/on-delay timer/single timer
Control output		NPN: load current:≤100mA; remaining voltage:≤1V PNP : load current:≤100mA; remaining voltage:≤1V
Circuit protection		Short circuit protection, overload protection, reverse polarity protection
Supply voltage		12...24VDC±10%,Ripple(P-P):≤10%

Power consumption *		NPN:normal:≤900mW(for 24V,≤36mA;for 12V:≤48mA)
		    power save mode:≤800mW(for 24V,≤32mA;for 12V:≤39mA)
		PNP:normal:≤950mW(for 24V,≤39mA;for 12V:≤52mA)
		    power save mode:≤850mW(for 24V,≤35mA;for 12V:≤44mA)

Anti ambient light		Incandescent:≤3,000lux;Daylight:≤10,000lux
Ambient temperature		-20...55℃(No freezing)
Environment humidity		35...85%RH(No condensation)
Vibration resistant		10...55Hz,Dual amplitude1.5mm(2h each for X,Y,Z direction)
Impulse withsand		500m/s^2,3 times each for X,Y,Z direction
Housing material		PC
Connection		2m PVC Cable
Weight		About 66g
Accessories		Operation manual 、 mounting bracket

*High speed mode makes an increase of 160mW（7mA）power consumption

■ Calibration mode

● Detect very subtle differences

Two-point calibration

Two-point calibration is the basic method of calibration.
You can set the sensitivity by pressing the [SET] button twice.
Press it once when placed and not placed.
Through beam type setting mode

Press the [SET] button when there are no workpieces

Workpiece

Press the [SET] button when there are workpieces

Setting completion

Sensoren

Reflective-type setting mode

Press the [SET] button when there are no workpieces

Press the [SET] button when there are workpieces

Workpiece

Setting completion

Two-point calibration works on the basis of whether there are workpieces or not.
The set point is the middle value of the above-mentioned two cases.
If the difference between the two cases is too small, "---" will flash for about two seconds after the calibration is completed.
■ Other modes of calibration

● Enhance the applicability in harsh environments such as dust

Maximum sensitivity setting

In the case shown below, press the [SET] button for more than 3 seconds. When the 5Et button flashes, release the button.
The set sensitivity is slightly higher than the received light intensity.

Through beam type : Workpiece

Workpiece

Press and hold for more than 3 seconds

Reflective-type : No workpiece

Press and hold for more than 3 seconds

## ■ Calibrate the moving workpiece

● Automatic calibration

Press and hold the [SET] button without placing workpieces. When "SEt" (Set) flashes, let workpieces through the sensing area. (Pre and hold the [SET] button while the workpieces passing through the sensing area.)
| Through beam type | and | Reflective-type | Unanimous |

Press the button until "SEt" (SET) flashes

Press the [SET] button when the workpieces pass through the sensing area

Setting completion

Workpiece

Sensoren

## ■ Initialization setting

● Initialization mode

1、Press and hold both buttons [SET] and [PRESET] for 3 seconds at the same time.
Press and hold for more than 3 seconds

2、Use ◁ ▷ to select " rSt " ,and then press the [MODE] button

3、Use ◁ ▷ to select " init " ,and then press the [MODE] button

When the initialization completes, the module redisplays the current value.

● Initial setting

Set	Initial value
Power mode	FINE
Detection mode	Std(normal)
set value	200
Switch of output	L-on

■ Switch of output

Optional mode is light on (L-on) or dark on (D-on)

1、When the current value is displayed, press the [MODE] button.

2、Use ⟨◁ ▷⟩ switch to the output(L-on d-on),and then press the [MODE] button again. After the output switch is completed, the module reapprears to display the current value.

■ Error display and corrective measures

Error display	ERC	ERE	END APC	LOC
Cause	Over-current exists in the control output	The internal data writing/ loading fails	Overload on the light source	Activate the key lock function
Solution	Detect the load and restore the current to the rated range	Perform initialization	Replace the sensor if you need high precision detection	Please refer to 《FD3-*B11R User Manual》 for the disable (setting) methods.

Sensoren
промышленные датчики

■ Preset function (through beam type)

When the light is received,press the [PRESET] button.Set the current value to "1000".

Press the [PRESET] button when there are no workpieces

Turn the blue "PST" light on

The set value is "500"   The curernt value is "000"
Press the [PRESET] button to change the set value and current value.

Apply preset when disable preset.
The set value is "500". The set value can be changed through normal calibration.

Apply preset when activate preset.
The set value remain unchanged only when the current value is "1000".

Note ──
The preset function and the zero shift function cannot be used at the same time. If you want to use the zero shift function, then make sure to turn off the preset function. This mode is not suitable for transparent workpieces or other detection environments with low light intensity difference.
──

● Disable the preset function

Press the [PRESET] button to disable the preset function.
When the preset function is disabled, the set value and current value remain the same.

Preset function plays a convenient role

This function is most suitable for situations where a simple detection is performed for the use of through beam optical fiber unit.
(For example: completely blocked detection. All optical axes of fiber unit are blocked by non-transparent workpieces)

Prompt

Sensoren
промышленные датчики

■ Zero shift function (Reflective)

The function is mainly used for reflective types.
Press the two buttons [PRESET] and [▶] at the same time.
The current value is " _0_ " .

Turn the blue "PST" light on

Display changes to " _0_ "

The zero shift function and the preset function cannot be used at the same time
If the use of preset is necessary,please turn off the zero shift function first.

● Disable the zero shift function

Press the [PRESET] button to disable the zero shift function.

⚠
Prompt

### The zero shift function plays a convenient role

This function is mainly used to set the current value to " _0_ " for reflective optical fiber unit.
After the reflective fiber unit is installed, the light intensity is sometimes not set to " _0_ " .
In this case, use the zero shift function to set the value to " _0_ " when there are no workpieces, so as to make the light intensity difference more noticeable.

■ Saturation recovery function

Press the [MODE] button and the [SET] button simultaneouly to enable the saturation recovery function.
Then the optical transmission level and the light intensity gain will be automatically callibrated.

Press the [MODE] button and [SET] button at the same time

Set the light intensity as shown in the figure below

Power mode	Intensity setting range
HIGH SPEED、 FINE	2047±350
SUPER	4095±500
MEGA	5000±600

● Disable the saturation recovery function

After enabling the saturation recovery function, press two buttons [MODE] button and [SET] button at the same time to cancel the enabling of this function.

Saturation recovery function plays a convenient role

⚠ **Prompt** This function is especially effective in the case where the light intensity value is saturated after installation.
This function automatically calibrates the optical transmission level and the light intensity gain through simple operation, so as to realize the correction saturation.
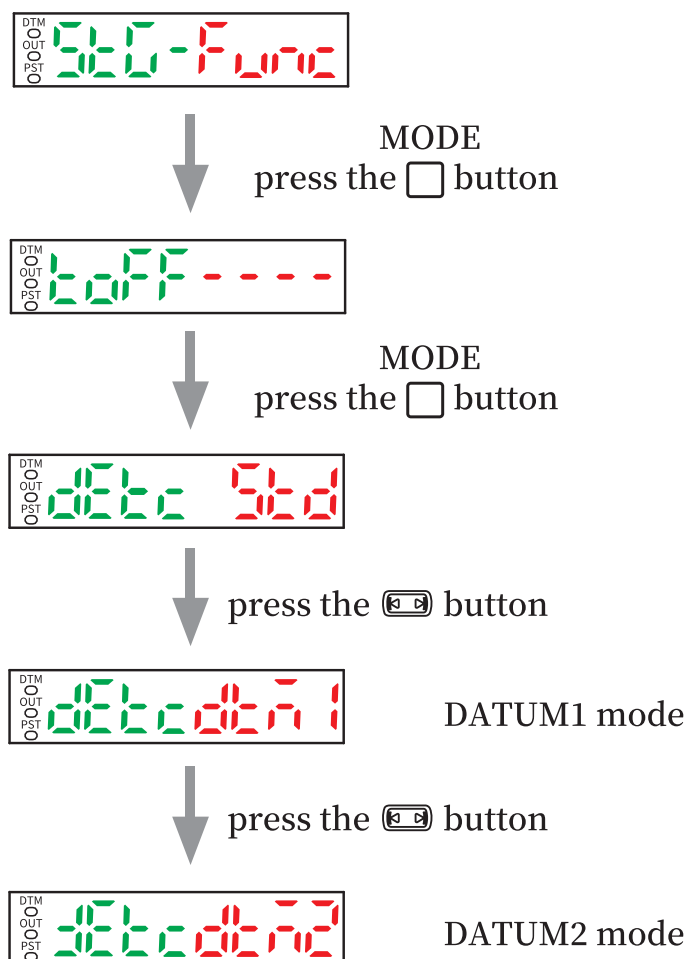

Sensoren
промышленные датчики

■ DATUM mode

The DATUM mode through beam type is suitable for environments where the intensity of the received light changes gradually.
For example, in the environments where optical fiber modules are vulnerable to be polluted or temperation changes drastically.

The DATUM mode is only suitable for the environments with strong reflective background and weak target reflection, such as black buttons on the white cloth.

In DATUM mode reflective type, the received light intensity without workpieces is always corrected to "1000" (for DATUM1) or "0" (for DATUM2). In addition, the set value is also corrected according to the amount of correction, so that the set value and the received light intensity remian the same, in this way, the stability detection will be achieved. The display of the set value won't change.
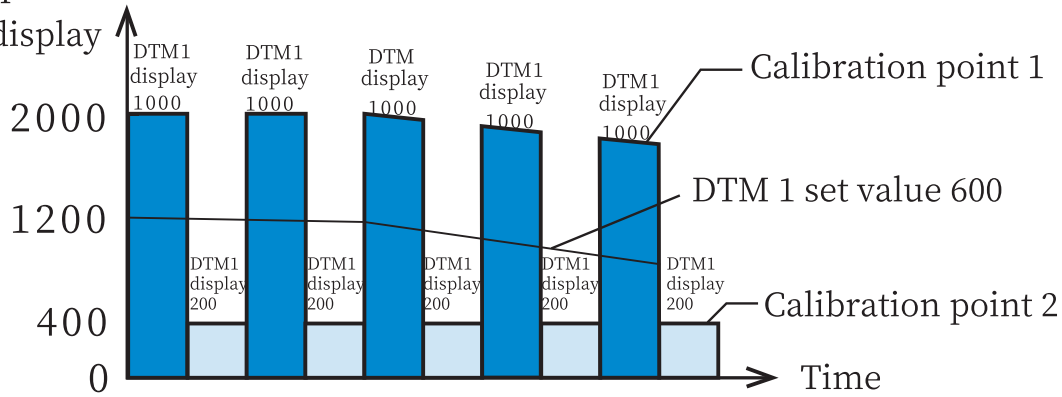

Enter the DATUM operation mode

StG-Func

• Change the warning output level

DATUM warning value refers to the middle value between the light intensity received by no workpieces and the set value. If the received light intensity falls between the warning value and the set value, the received light intensity will stop correcting, and the DTM indicator light flashes as a warning.

If the received light intensity fails to rise to the warning value when there are no workpieces, (for example, because the optical axis is not aligned), the DTM indicator flashes a warning.

■ **Usage and precautions of optical fiber cutters**

● Use fiber optic cutters

   1. Insert the optical fiber into the cutter hole.
   2. Quickly press the blade to cut the fiber in one go.
   3. Put the fiber into the fiber amplifier to put it to use.

Fiber optic cutters

2 holes for thin fiber

Standard fiber
（∅2.2mm）3 holes for use
*Fiber Cutter is sold separately

Sensoren
промышленные датчики

■ Precautions for the use of optical fiber cutter

failure to follow the instructions below may reduce the detection area

Stopping cutting in the middle may result in uneven sections, so as to narrow the detection range. Do not cut twice in the same hole.
