Automation light grid

Model Number

LGM8

Light grid

with fixed cable with 4-pin, M12 x 1 connector, and fixed cable with 8-pin, M12 x 1, connector

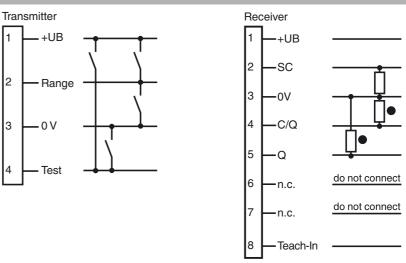

Features

- Measuring automation light grid with • switching output
- Optical resolution 8 mm .
- Super-fast object detection, even with . 3-way beam crossover
- Object identification using integrated object recognition
- IO-link interface for service and process data
- Temperature range to -30 °C
- Output of a measured value, can be • selected from a number of measuring functions

Product information

Automation light grids in the LGM Series are designed to measure small to large objects. The slimline light grids are modular in design and are available with various beam gaps and field heights. The entire signal evaluation process is carried out within the device. The lightweight systems can be integrated elegantly into their surroundings, from both a technical and a visual perspective. As a result, machines and plants operating in temperature ranges between 30 °C ... +60 °C can be designed to more compact dimensions.

Technical data			Accessories
General specifications			OMH-SLCT-06
Effective detection range		Standard : 0.3 6 m	Swivel Bracket
Threshold detection range		7.5 m	
Light source		IRED	OMH-SLCT-01
Light type Field height		modulated infrared light , 850 nm see Table 1, max. 2100 mm	Quick clamp and adjustment system
Beam crossover			V19-G-EMV-BK0,3M-PVC-V19-G
Beam blanking		Factory setting: three beam crossing, deactivateable adjustable max. 2 fixed suppressible beam areas (blanking)	Double-ended cordset, M12 to M12, w
Beam spacing		8.33 mm	
Number of beams		see Table 1, max. 253	EMC filter, 8-pin, PVC cable
Operating mode		Emitter: Emitter power adjustable in two ranges	OMH-SLCT-03
Optical resolution		without beam crossover: 8 mm with beam crossover: 4 mm with in 25% and 75% of the range	Mounting bracket including adjustmer
Angle of divergence		10 °	OMH-SLCT-04
Ambient light limit		> 50000 Lux (if external light source is outside the opening angle)	Mounting bracket including adjustmer (with loose bearing)
Functional safety related para	meters		
MTTF _d		21 a	OMH-SLCT-05
Mission Time (T _M)		20 a	Mounting bracket including adjustmer
Diagnostic Coverage (DC)		60 %	AA SLCT-01
Indicators/operating means			Profile alignment aid; simplified alignment
Operation indicator		LED green: constantly on - power-on double pulse flashing (0.8 Hz) - undervoltage flashing (4 Hz) - short circuit	of the SLCS and SLCT safety light curtains
Status indicator		flashing with short interruptions (1 Hz) - IO-Link mode Emitter: LED yellow constantly on - high emitter power constantly off - low emitter power flashing (8 Hz) - error message	V1-G-BK2M-PUR-U Female cordset, M12, 4-pin, PUR cab V1-G-BK5M-PUR-U
		Receiver: LED yellow: constantly on - object detected constantly off - no object detected flashing (4 Hz) - below stability control limit	Female cordset, M12, 4-pin, PUR cab V1-G-BK10M-PUR-U Female cordset, M12, 4-pin, PUR cab
		flashing (8 Hz) - error message	Female colusel, MTZ, 4-pin, FOR Cab
Control elements Electrical specifications		Receiver: 2 touch buttons for programming	V1-G-BK15M-PUR-U Female cordset, M12, 4-pin, PUR cab
Operating voltage	UB	18 30 V DC	-
Ripple		10 %	V19-G-BK10M-PUR-IEC
No-load supply current	Ι _Ο	Emitter ≤: 50 mA Receiver: ≤ 150 mA (without outputs)	Female cordset, M12, 8-pin, PUR-cab
Time delay before availability	t _v	see Table 1, max. 3.8 s	V19-G-BK2M-PUR-IEC
Interface			Female cordset, M12, 8-pin, PUR-cab
Interface type		IO-Link (pin 4)	V19-G-BK5M-PUR-IEC
IO-Link Revision		1.0	Female cordset, M12, 8-pin, PUR-cab
COM-Mode		COM 2 (38.4 kBaud)	Temale coruset, WTZ, o-pin, TOT-cab
Min. cycle time		2.3 ms	V19-G-BK2M-PUR-U-V1-G
Process data witdh		16 bit	Connection cable, M12 to M12, 8/4-pi
SIO mode support		yes	PUR cable
Device ID		1050369 1050389 (0x100701 0x100715)	
Input			IO-Link-Master02-USB
Test input		Emitter switch-off with +UB or 0 V at pin 4 (emitter)	IO-Link master, supply via USB port o
Function input		Range input activation from 1.6 m with +UB or 0 V on pin 2 (emitter) Teach-In input for parameterization on pin 8 (receiver)	separate power supply, LED indicator M12 plug for sensor connection
Output			10 Link Maater USB DTM
Pre-fault indication output		Stability Control (SC) 1 PNP, short-circuit protected, reverse polarity protected on pin 2 (receiver)	IO-Link-Master-USB DTM Communication DTM for use of IO-Lin
Switching type		Factory setting: dark on , Switchable to light-on mode	Master
Signal output		Command interface: Pin 4 IO-Link interface C or used as switching output Q; 1 short-circuit proof reverse polarity protected push-pull output (receiver)	PACTware 4.1 FDT Framework
		Switch output: Pin 5 switching output Q; 1 short-circuit proof reverse polarity protected push-pull output (receiver) synchronized with pin 4	IODD Interpreter DTM
Switching threshold		Factory setting: The signal tracking for the threshold value is deactivated, increasing the optical resolution by a maximum of 4 mm; switchable to active signal tracking	Software for the integration of IODDs i frame application (e. g. PACTware)
Switching voltage		max. 30 V DC	LGM IODD
Switching current		max. 100 mA	IODD for communication with LGM-IC
Voltage drop	U _d	≤ 2 V DC	Link sensors
Switching frequency	f	see Table 1, max. 118 Hz	LGM DTM
Response time		see Table 1, max. 20 ms	DTM for communication with LGM
Timer function		Off-delay programmable from 0 1.25 s in 5 ms steps (adjustment via IO-Link only)	sensors
Conformity			V1-G-BK0,6M-PUR-U-V1-G-LGS25T
Communication interface		IEC 61131-9	Cordset, LGS25 light grids to ICE
Product standard		EN 60947-5-2	modules/WIS 2, M12 to M12, PUR cat

Operating principle

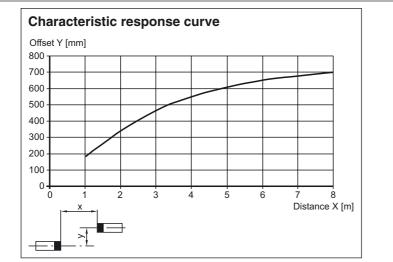

The light grid comprises a transmitter unit and a receiver unit; the monitored surface is located between these units. The switching command and measurement of the object is triggered when an object enters or is already present in the monitoring field.

The system's modular construction allows even the most diverse gaps between light beams to be implemented, enabling light grids in the LGM Series to be used to optimum effect and tailored to the specific application in question.

The system is programmed via the integrated touch field or via the IO-Link interface. Output of the analog measured value is included in the IO-Link protocol. Users can choose from a vast selection of integrated measurement protocols. The most important measurement protocols are:

- Lowest position of the object ٠
- Highest position of the object
- Height of the object
- Height of the object as the total height of all partial objects ٠
- Height of the largest partial object ٠
- Mid-position of the largest partial object •
- Lowest position of the largest partial object ٠
- Highest position of the largest partial object
- ...

Design and Function

Safety information

The system must be maintained and inspected on a regular basis.

A soft, clean cloth may be used to clean the system. Do not use any aggressive or abrasive cleaning agents that will corrode the surfaces. The device must not be subjected to severe impacts or vibrations.

Commissioning

Prerequisites

- The transmitter unit and receiver unit have been mounted and aligned correctly.
- The electrical connection has been established as per the information in the connection diagram. .

Release date: 2019-08-26 14:02

If at least one beam of light is interrupted, the output remains active for as long as the object is detected.

Troubleshooting

- Measure operating voltage
- Check cabling.
- Check transmitter and receiver unit for dirt. Clean if necessary.

Function indicators

A green LED for indicating the operating status "Power ON" and a yellow status indication LED are fitted on the connection side of the profiles, behind the lens cover.

Transmitter Unit

Function	Description of Diagnosis
Green LED to display operating status permanently illuminated	Power On
Green LED to display operating status is not illuminated. Yellow LED to indicate status is flashing	Energy-saving mode
Yellow LED to indicate status is not illuminated	Transmission power of transmitter is low
Yellow LED to indicate status is permanently illuminated	Transmission power of transmitter is high
Yellow LED to indicate status is flashing rapidly (approx. 8 Hz)	Fault state
Yellow LED to indicate status — brief change in light emitted	Test input is activated

Receiver Unit

Function	Description of Diagnosis
Green LED to display operating status permanently illuminated	Power On
Green LED to display operating status is not illuminated	Energy-saving mode
Green LED to display operating status is flashing at brief intervals	IO-Link mode active. Possible to parameterize the device only via IO-Link
Green LED to display operating status is flashing (4 Hz)	Fault status: short circuit at the outputs
Yellow LED to indicate status is permanently illuminated	Detection field interrupted
Yellow LED to indicate status is not illuminated	Detection field is clear.
Yellow LED to indicate status is flashing (approx. 4 Hz)	Insufficient stability control
Yellow LED to indicate status is flashing rapidly (approx. 8 Hz)	Fault state: fault during signal measurement

Resolution and Beam Gap

The optical resolution of the light grid corresponds to the size of the object that can be detected.

The values specified in the technical data under "Optical Resolution" apply if signal tracking for the threshold value is activated. Where the system is parameterized via the touch field menu (level 2, "Signal Tracking"), the value is automatically set to 60%. It is not possible to set other values. To parameterize the system via IO-Link, a threshold value of at least 60% must be entered. Signal tracking for the threshold value is deactivated by default, increasing the optical resolution by a maximum of 4 mm. By selecting 3-way crossover of the light beams, the resolution of the light grid is refined.

The switching outputs respond to any instance in which the beam is interrupted by an object. Selective object detection can also be parameterized using predefined or taught-in objects. Up to 2 beam areas can be suppressed (blanking).

The devices are supplied without object detection programmed, with signal tracking of the threshold value deactivated, and with a beam path with a 3-way crossover.

Resolution of the Crossed Beam Arrangement

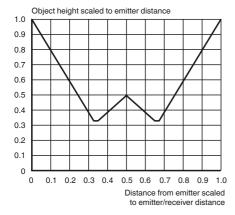

If 3-way beam crossover is programmed, the resolution is refined. In the case of 3-way crossover, this means that the increased resolution is offered once 25% of the transmitter unit range or receiver unit range has been covered. It is therefore necessary to ensure that all objects pass the transmitter or receiver with such a gap.

LGM8

The sensor parameters are device-specific and are described in the standardized IO Device Description file (IODD). The IODD can be read into different engineering tools using IODD support from different system providers. The sensor can then be configured or diagnosed using the relevant tool and a user interface generated from the IODD.

The IODD interpreter are available in the corresponding product description on our homepage, www.pepperl-fuchs.com. For the IODD description contact the P+F support.
