## **Integral system diagnosis (ISD)**

Note (ISD -Faults)	The following faults are registered by the safety monitoring modules and indicated by ISD.  Failure of the safety relay to pull-in or drop-out Failure of door contacts to open or close Cross-wire or short-circuit monitoring of the switch connections Interruption of the switch connections Fault on the input circuits or the relay control circuits of the safety monitoring module

## **Other data**

Note (applications)	Safety sensor Guard system
---------------------	-------------------------------

## **Notes**

Note (General)	Inductive loads (e.g. contactors, relays, etc.) are to be suppressed by means of a suitable circuit.
----------------	--

## **Circuit example**

Note (Wiring diagram)	The wiring diagram is shown with guard doors closed and in de-energised condition.  To secure a guard door up to PL d and Category 3 Monitoring 1 guard door(s), each with a magnetic safety sensor of the BNS range The ISD tables (Integral System Diagnostics) for analysis of the fault indications and their causes are shown in the appendix. Modification for 2 NC contacts: The safety monitoring module can be modified to monitor two NC contacts by bridging the terminals X3 and X4. In this configuration, the short-circuit detection becomes inoperative. Inversion of the output function: By establishing a bridge between X5 and X6, the output function of the additional outputs can be altered. This control can also be realised when e.g. a PLC is running (24 VDC at terminal X6). Expansion of the enable delay time. The enable delay time can be increased from X7 s to X8 s by mounting a jumper connection between the terminals 0,1 and 1.
