# **Model Number**

# OQT350-R201-2EP-IO-0,3M-V31-L

Triangulation sensor (SbR) with fixed cable and 4-pin, M8 connector

### **Features**

- Medium design with versatile mounting options
- Multi Pixel Technology (MPT) flexibility and adaptability
- Reduction of device variety several switch points within one sensor
- Reliable detection of all surfaces, independent of color and structure
- · Low sensitivity to target color
- IO-link interface for service and process data

# **Product information**

The optical sensors in the series are the first devices to offer an end-to-end solution in a medium-sized standard design—from the thru-beam sensor through to the measuring distance sensor. As a result of this design, the sensors are able to perform practically all standard automation tasks.

The entire series enables sensors to communicate via IO-Link.

The DuraBeam laser sensors are durable and can be used in the same way as a standard sensor.

Multi Pixel Technology (MPT) ensures that the standard sensors are flexible and can be adapted to the application environment.

## Teach-In (TI)

Use the rotary switch for switching signal Q1 or Q2 to select the relevant switching threshold A and/or B to teach in.

• The yellow LEDs indicate the current state of the selected output.

To teach in a switching threshold, press and hold the "TI" button for approximately 1 s, until the yellow and green LEDs flash in phase. Teach-in starts when the "TI" button is released.

- Teach-in successful: the yellow and green LEDs flash alternately at 2.5 Hz.
- Teach-in unsuccessful: the yellow and green LEDs quickly flash alternately at 8 Hz.

After an unsuccessful Teach-in, the sensor continues to operate with the previous valid setting after the relevant visual fault signal is issued.

Set switching mode: you can define different switching modes by teaching in the relevant distance data for switching thresholds A and B.

1. Single point mode:

295670-100329\_eng.xml

#### 2. Window mode:

Teach in switching thresholds: you can teach in or overwrite a taught-in switching threshold at any time. To do this, press the "TI" button again.

Reset a value: you can reset a taught-in value. To do this, press the "TI" button for > 4 s, until the yellow and green LEDs go out. The reset process itself starts when the "TI" button is released.

Reset successful: the yellow and green LEDs flash alternately at 2.5 Hz.

# **Resetting to Factory Settings**

To revert back to factory settings, press the "TI" button for > 10 s with the rotary switch set to position "O," until the yellow and green LEDs go out at the same time. The reset process itself starts when the "TI" button is released.

 Reset to factory settings successful: the yellow and green LEDs light up at the same time. The sensor then continues to operate with factory settings.

#### OQT

- Factory setting for switching signal Q1:
  - Switching signal high active, BGS mode (background suppression)
- Factory setting for switching signal Q2:
- Switching signal high active, BGS mode (background suppression)

# Configuration via IO-Link interface

# Configuring different operating modes via the IO-Link interface

The devices are equipped with an IO-Link interface as standard for diagnostics and parameterization tasks to ensure optimum adjustment of the sensors to the relevant application. Four different operating modes can be set, among other features:

# Background suppression operating mode (one switch point):

• Detection of objects irrespective of type and color in a defined detection range. Objects in the background are suppressed.

active detection range

Background suppression

# Background evaluation operating mode (one switch point):

• Detection of objects irrespective of type and color against a defined background. Reliable detection of objects at close range (detection range >= 0 mm). The background serves as reference.

active detection range

Background evaluation

# Single point mode operating mode (one switch point):

- · Detection of objects irrespective of type and color in a defined detection range. Objects in the background are suppressed.
- The switch point corresponds exactly to the set point.

active detection range

Background suppression

# Window mode operating mode (two switch points):

- Detection of objects irrespective of type and color in a defined detection range. Reliable detection when object leaves the detection range.
- · Window mode with two switch points.

active detection range

Foreground suppression

Background suppression

# Center window mode operating mode (one switch point):

• Detection of objects irrespective of type and color in a defined detection range. Sets a defined window around a given object. Objects outside this window are not detected.

Release date: 2019-06-26 12:58 Date of issue: 2019-10-31 295670-100329\_eng.xml

· Window mode with one switch point.

# Two point mode operating mode (hysteresis operating mode):

• Detection of objects irrespective of type and color between a defined switch-on and switch-off point.

### Inactive operating mode:

• Evaluation of switching signals is deactivated.
